Introduction

Digital transformation is a driving force in business. No matter the industry, organisations continue to accelerate digital initiatives to advance their business and gain a competitive edge. That focus is more important than ever today as the world begins to move beyond the global pandemic into a new post-Covid reality.

The cloud has been vital in helping organisations adapt to changes in the business landscape and evolving customer demands. While early digitization strategies focused on understanding where and how the cloud could benefit the business, those views have shifted and become more encompassing. Organisations today see cloud as a critical part of their overall technology portfolio, whether that means a hybrid environment or going “all in” on the cloud.

Cloud has become an important tool for addressing top business priorities in the post-pandemic landscape and to help organisations move faster, be more resilient and adaptable to change, and strengthen security postures. And yet, while organisations recognise the value and power of the cloud, getting started migrating to the cloud and modernising resources can feel challenging.

Microsoft is committed to simplifying your cloud migration and modernisation experience so you can deliver value to your organisation faster.

Join us as we share insights on how you can make progress on migration and modernisation initiatives, plus best practices for getting started with Microsoft Azure.

**Enterprises
are accelerating
digital
transformation**

72%

of organisations reported their industry's pace of transformation has been accelerating as a result of the pandemic.¹

80%

of enterprises will have the mechanism in place by the end of 2021 to shift to cloud-centric infrastructure and applications, twice as fast as before the pandemic.²

The business benefits of cloud

The inherent properties of cloud, including elasticity, high availability, security, scalability, and more, open a multitude of benefits for organisations. These benefits offer you ways to create significant business advantages while accelerating digital transformation initiatives.

Customers that adopt Microsoft Azure can improve:

Security

Providing greater protection across your cloud and on-premises environments with security and threat detection services.

Time to market

Making it easier to innovate and bring new products, services, or enhancements to your customers at an accelerated pace.

Business insights

Providing a path to unify disparate data sources and bring a richer understanding of your customers, products, and services through data insights and analytics.

Scalability

Enabling you to meet surges in customer demand as needed, without straining your operations teams, infrastructure, or budgets.

Resiliency

Helping you with disaster recovery and other backup strategies so you can ensure greater business continuity.

Cloud at your pace

Making it possible to migrate at your own pace with solutions that simplify management and governance of cloud and on-premises IT estates.

Modernisation

Uncovering efficiencies and helping to attract and retain customers and employees with modern apps and infrastructure.

Sustainability

Providing insights and reporting on your IT carbon emissions so you can effectively make progress on your organisation's sustainability goals.

Costs

By shifting from a legacy capital expenditure model to a more flexible operational expenditure model, reduce costs, paying only for the resources and services you consume.

Cost and operational efficiencies with Microsoft Azure

Up to **25%** increase in productivity of IT staff.³

\$10M savings from avoided on-premises infrastructure and staff costs.⁴

478% three-year return on investment.⁴

Up to **80%** savings with Azure Hybrid Benefit.³

Value of cloud migrations and modernisation

Making progress on your digital goals with Microsoft Azure starts with a migration and modernisation journey. The two initiatives are closely related yet bring different advantages for you to consider.

Migrations involve moving applications, infrastructure, and data from your private, on-premises datacenter to the public or hybrid cloud. Migrations give you the foundation for an elastic, scalable, and secure infrastructure.

A cloud migration will help you start to realize several important benefits. For example, your organisation may experience lower IT costs by rightsizing capacity, so you are only spending on the compute and storage resources that you use. When you need greater capacity, you can easily scale up usage, giving you a more flexible approach. You'll also be able to strengthen your overall security posture through Azure's comprehensive security controls, and benefit from Microsoft's \$1 billion annual investment in securing its cloud environments.

Modernisation initiatives, on the other hand, involve updating existing or legacy applications to incorporate newer computing approaches, such as modern application frameworks or cloud-native technologies. Modernisation allows you to innovate existing applications to provide better user experiences, greater business agility, and cost efficiencies. By adopting modern frameworks and technologies, you enable greater developer velocity, making it easier for your people to create, test, and launch new innovations.

Often, modernisation projects build on migration to the cloud. For example, moving data to the cloud opens the door to gaining more value from the integration across your data and applications. Once your data is in the cloud, you can extend your cloud infrastructure foundation to apply more advanced analytics, or even integrate AI/ML approaches to glean richer and predictive insights from your data estate.

Turn your data into a strategic asset

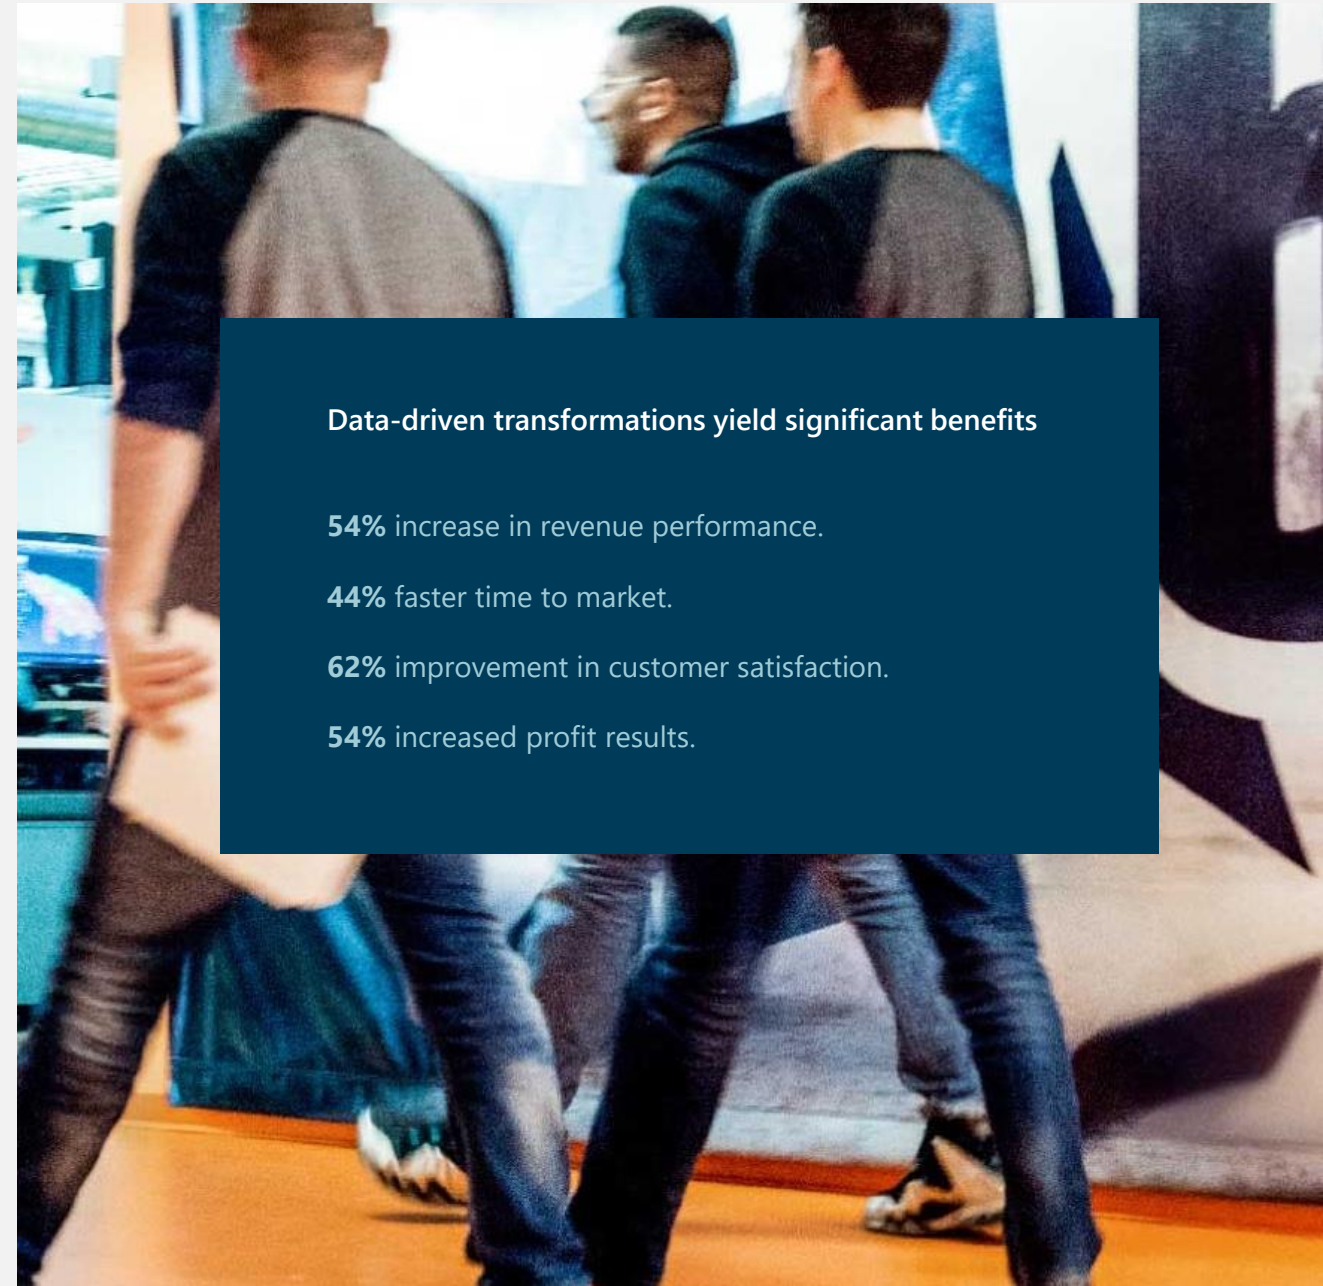

When your data is in the cloud, you have the opportunity to turn it into one of your most strategic assets. Studies have shown that organisations that embrace the value of data fare better in adjusting to rapid market changes: they are able to be more agile, anticipate and predict change, and pivot as needed to better serve customers.

Yet for many organisations, extracting more value from data has not been easy. The volume, variety, and velocity of data are all accelerating, making it challenging to get a holistic view of data estates. That complexity makes it difficult to answer fundamental questions, like:

- What data do I have? Is it trustworthy?
- Are we managing all this data in a compliant way?
- Are people getting the data they need to make the right decisions?
- Are they getting this data fast enough?

A cloud-based approach to data can help you answer these questions by unifying and connecting all your data assets. You'll be able to scale and accelerate your approach to data so that you can harness and analyze a constant stream of data, applying analytics and AI to glean rich insights and drive better decisions.

In essence, you'll create a positive digital feedback loop where you'll be able to drive greater transformation to improve customer experiences, transform products and services based on signals from users, empower employees to be more productive, and more.

Data-driven transformations yield significant benefits

54% increase in revenue performance.

44% faster time to market.

62% improvement in customer satisfaction.

54% increased profit results.

Successful migration and modernisation use cases

Migrating to the cloud is just the beginning. As you begin your journey to the cloud, you can take advantage of additional cloud capabilities that yield value in other areas.

Let's look at some of the most popular use cases explored by our customers.

Legacy system modernisation

Create a strong infrastructure foundation by moving legacy infrastructure to Azure. You'll be able to take advantage of Azure services that help boost performance and increase operational efficiencies for your organisation.

Accelerate innovation

With the pace of business continuously accelerating, organisations need to decrease time to market, ensuring new innovations are accessible to customers faster. Azure provides a fully managed platform with robust tools and capabilities to meet your application development needs - from migrations to legacy application modernisations to building new cloud-native applications, and more - so your people can make progress faster.

Security and compliance

With security a top priority for business and technology leaders, organisations are looking to the cloud for all the ways it can help in protecting valuable data, apps, and infrastructure. Azure offers a secure cloud foundation with multilayered, built-in security controls and unique threat intelligence to help your security teams identify and protect against evolving threats.

Data estate modernisation

Many organisations today struggle to gain additional value from the large and distributed data estates within the business. Azure's data and analytics services provide a path to unify that data in the cloud and make it easier to gather, store, process, analyse, and visualise your data to gain better and more actionable insights for your organisation.

Application modernisation

Modernise legacy applications to deliver enhanced experiences to your customers and employees. Azure also makes it easier to develop new applications, so you can build, manage, and continuously deliver improved application experiences.

Support hybrid IT estates

Many organisations take a gradual approach to the cloud, migrating some core systems and applications but also maintaining legacy on-premises infrastructures and applications. Microsoft has built Azure with that reality in mind: it's designed to help you bring the agility and innovation of the cloud to your on-premises environments. Azure provides a holistic, seamless, and secure approach that's consistent across your on-premises and cloud resources.

82% of enterprises have a hybrid cloud strategy.⁵

92% of enterprises have a multicloud strategy.⁵

Key drivers

- Legacy systems/custom requirements
- Regulations and data sovereignty
- Latency and technical hurdles
- Consequence of no proactive strategy

Flexible ways to get started

When approaching either a migration or modernisation initiative, Azure provides flexible options for getting started. You can opt to handle the migration on its own or alongside modernisation goals, depending on your organisation's needs.

Focusing on the migration first provides the benefit of letting you reduce your datacenter footprint quickly. You realize more immediate cost savings as a result. And this approach allows more time for testing and optimizing applications to ensure cloud readiness.

Adding modernisation workstreams while you are migrating helps you decrease your time to market. Rather than the most rapid cost savings, you'll be focusing more on unlocking application innovations that deliver richer user experiences and enhance productivity. At the same time, you'll have the opportunity to accelerate the velocity of application development.

Your approach doesn't have to be all one way or the other. You have flexibility to choose to directly migrate some systems and apps, while other systems and apps might benefit more from a modernisation effort.

Even more importantly, you don't have to migrate everything at once. Azure gives you the flexibility to migrate at your pace, supporting you with hybrid solutions that make managing and governing cloud and on-premises assets easier and enabling consistent experiences across both domains.

Performing a Cloud Readiness Assessment can help you select your path forward, determine the effort required to migrate or modernize, and gauge the timing that would be most beneficial for your organisation.

Migration and modernisation considerations

What's the immediate business need?

- Optimising costs
- Shifting from CapEx to OpEx
- Realising cloud benefits quickly

How hard is it to do?

- Complexity
- Level of skilling or retraining needed, or new staff required
- Cost and resources needed to refactor or rebuild

Longer-term business goals?

- Time to market
- App innovation
- Productivity
- Application development velocity

Solving today's top industry challenges with cloud

Beyond the most common use cases, organisations across all industries are using cloud to not only advance their digital transformation strategies, but also solve industry-specific challenges. Explore these industry snapshots of what's possible by moving to the cloud.

Retail

Digital transformation is a top priority for retailers to support evolving buyer patterns, from the increased interest in contactless shopping and curbside pickup, to greater demand for more personalised digital experiences.

The cloud is helping retailers transform so they can:

- Reimagine the retail experience
- Build more resilient supply chains
- Know their customers better

The **Albertsons** family of brands gains agility and scalability at lower cost to support an increase in digital sales by migrating to Azure.⁶

Manufacturing

Manufacturers are turning to the cloud to help them become more agile, innovative, and competitive in their markets. Integrated technology is vital to helping attract the next generation of employees and building next-gen factories that are automated, efficient, and resilient.

Cloud is helping manufacturers to:

- Create more agile factories
- Increase supply chain resiliency
- Unlock innovation and deliver new services

Outokumpu, a Finnish manufacturer, uses Azure to increase output by 10-15 percent, while reducing quality defects by up to 40 percent.⁷

Financial services

Within Financial Services, increasing and evolving regulations, as well as rising cyber and financial crime, make compliance and security top priorities. Also important are increasing agility, modernizing aging systems, and delivering richer digital experiences to customers.

Financial services firms look to cloud to:

- Deliver differentiated customer experiences
- Modernise core banking and payments
- Manage risk across the organisation
- Protect against financial crime

Dutch-based **ABN AMRO** unlocks data insights for better decision-making with an Azure-based data mesh solution.⁸

Healthcare

The pandemic has accelerated several trends within the Healthcare industry, from the rise in virtual healthcare to the need to protect sensitive data from cybercrime while at the same time making data more accessible to providers and patients.

Healthcare organisations are using cloud to:

- Enhance patient engagement
- Improve clinical and operational insights
- Protect health information.

New South Wales Health Pathology modernizes health diagnostics with an Azure-based, large-scale digital health platform.⁹
